

***o*-Quinodimethane Atropisomers: Enantioselective Synthesis and Stereospecific Transformation**A. Ostertag¹, J. Dong¹, C. Sparr^{1*}¹Department of Chemistry, University of Basel, St. Johannis-Ring 19, 4056 Basel, Switzerland

The use of *o*-quinodimethanes as reactive intermediates in Diels-Alder reactions is a versatile approach to synthesize complex polycyclic compounds.^[1] There are different precursors to thermally generate *o*-quinodimethanes,^[2] but due to the required high temperatures and the high reactivity of *o*-quinodimethanes, stereoselectivity to afford isomerically defined products constitutes a major challenge. Since our group is interested in developing methodologies for the synthesis of axially chiral biaryls by *de novo* ring construction,^[3] we aimed to identify atropisomeric *o*-quinodimethanes. In this work we describe an intramolecular catalyst-stereocontrolled [2+2+2] cycloaddition of triyne substrates to generate atropisomeric benzocyclobutenes, benzocyclic sulfones and benzosultines which serve as precursors for the rotationally restricted aryl-*o*-quinodimethanes. Owing to their remarkable configurational stability, no racemization of the stereogenic axis occurs during the thermal ring opening. This allows for highly stereospecific Diels-Alder reactions of the *in situ* formed *o*-quinodimethanes with various dienophiles to form various polycyclic biaryls.
