In our effort to discover novel selective and non-toxic agents effective against CRC, we synthesized a series of rhenium(I) tricarbonyl-based complexes with increased lipophilicity. Two of these novel compounds were discovered to possess remarkable anticancer, anti-angiogenic and antimetastatic activity in vivo (zebrafish-human HCT-116 xenograft model), being effective at very low doses (1-3  $\mu$ M). At doses as high as 250  $\mu$ M the complexes did not provoke toxicity issues encountered in clinical anticancer drugs (cardio-, hepato-, and myelotoxicity). In vivo assays showed that the two compounds exceed the anti-tumor and anti-angiogenic activity of clinical drugs cisplatin and sunitinib malate, and display a large therapeutic window.[\[1\]](#)

In another study, we reported a rhenium(II) dicarbonyl complex, which displayed better cytotoxicity against MCF-7 breast cancer cells than cisplatin.[\[2\]](#) We investigated later new synthetic routes to aerobically stable and substitutionally labile  $\alpha$ -diimine rhenium(I) dicarbonyl complexes. The molecules were prepared in high yield from the *cis-cis-trans*-[Re(CO)<sub>2</sub>(<sup>t</sup>Bu<sub>2</sub>bpy)Br<sub>2</sub>]<sup>-</sup> anion ( where <sup>t</sup>Bu<sub>2</sub>bpy is 4,4'-di-*tert*-butyl-2,2'-bipyridine), which could be isolated from the one electron reduction of the corresponding 17-electron complex. Ligand substitution of Re(I) complexes proceeded via pentacoordinate intermediates capable of Berry pseudorotation. In addition to the *cis-cis-trans*-complexes, *cis-cis-cis*- (all *cis*) isomers were also formed. [Re(CO)<sub>2</sub>(<sup>t</sup>Bu<sub>2</sub>bpy)Br(L)] complexes may be considered as synthons for the preparation of a variety of new stable diamagnetic dicarbonyl rhenium *cis*-[Re(CO)<sub>2</sub>]<sup>+</sup> complexes, offering a convenient entry in the chemistry of the core.[\[3\]](#)
